Note:

^{1.} Based upon review of the meteorological data in concert with the report of roof cleaning activities it has been determined that the elevated PCME reading on July 26, 2006 at Station 9 (Northwest Area [roof level]) was likely associated with work activities at 130 Liberty Street. The cumulative PCME average for Station 9 reflecting the period July 6, 2006 (start date for monitoring) through July 26, 2006 is 0.00093 F/cm3. Corrective actions that have been instituted include the following: increased use of amended water to wet materials during abatement activities to counter high rate of evaporation due to excessive rooftop temperatures and increased wet misting of work area during abatement operations.
